CSCI 127: Introduction to Computer Science

hunter.cuny.edu/csci

Today's Topics

- \bullet Recap: Logical Expressions & Circuits
- Design: Cropping Images
- Accessing Formatted Data

Today's Topics

- Recap: Logical Expressions & Circuits
- Design: Cropping Images
- Accessing Formatted Data

Recap: Logical Operators

and

in1		in2	returns:
False	and	False	False
False	and	True	False
True	and	False	False
True	and	True	True
		or	

in1		in2	returns:
False	or	False	False
False	or	True	True
True	or	False	True
True	or	True	True

not

	in1	returns:
not	False	True
not	True	False

Logical Operators & Circuits

 Each logical operator (and, or, & not) can be used to join together expressions.

Example: in1 and in2

 Each logical operator (and, or, & not) has a corresponding logical circuit that can be used to join together inputs.

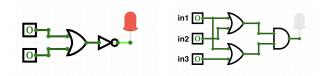

Examples: Logical Circuit

(in1 and in2) and in3

More Circuit Examples

Examples from last lecture:

Draw a circuit that corresponds to each logical expression:

- o not(in1 or in2)
- (in1 or in2) and (in1 or in3)
- (not(in1 and not in2)) or (in1 and (in2 and in3))

Today's Topics

- Recap: Logical Expressions & Circuits
- Design: Cropping Images
- Accessing Formatted Data
- CS Survey: Astrophysics and astropy

Group Work: Design Question

From Final Exam, Fall 2017, V4, #6.

Design an algorithm that reads in an image and displays the lower left corner of the image.

Input:

Output:

Process:

Group Work: Design Question

Design a program that asks the user for an image and then display the upper left quarter of the image. (First, design the pseudocode, and if time, expand to a Python program.)

How to approach this:

- Create a "To Do" list of what your program has to accomplish.
- Read through the problem, and break it into "To Do" items.
- Don't worry if you don't know how to do all the items you write down.
- Example:
 - Import libraries.
 - 2 Ask user for an image name.
 - 3 Read in image.
 - 4 Figure out size of image.
 - Make a new image that's half the height and half the width.
 - O Display the new image.

Group Work: Design Question

- Import libraries. import matplotlib.pyplot as plt import numpy as np
- ② Ask user for an image name.
 inF = input("Enter file name: ")
- 3 Read in image. img = plt.imread(inF) #Read in image from inF
- Figure out size of image.
 height = img.shape[0] #Get height
 width = img.shape[1] #Get width

CSCI 127 (Hunter)

- Make a new image that's half the height and half the width. img2 = img[height//2:, :width//2] #Crop to lower left corner
- ⑤ Display the new image.
 plt.imshow(img2) #Load our new image into pyplot
 plt.show() #Show the image

October 3 2023

11 / 31

Lecture 6

Today's Topics

- Recap: Logical Expressions & Circuits
- Design: Cropping Images
- Accessing Formatted Data
- CS Survey: Astrophysics and astropy

Structured Data

		Undergraduate	
College	Full-time	Part-time	Total
Baruch	11,288	3,922	15,210
Brooklyn	10,198	4,208	14,406
City	10,067	3,250	13,317
Hunter	12,223	4,500	16,723
John Jay	9,831	2,843	12,674
Lehman	6,600	4,720	11,320
Medgar Evers	4,760	2,059	6,819
NYCCT	10,912	6,370	17,282
Queens	11,693	4,633	16,326
Staten Island	9,584	2,948	12,532
York	5,066	3,192	8,258

- Common to have data structured in a spread sheet.
- In the example above, we have the first line that says "Undergraduate".
- Next line has the titles for the columns.
- Subsequent lines have a college and attributes about the college.
- Python has several ways to read in such data.
- We will use the popular Python Data Analysis Library (Pandas).

CSCI 127 (Hunter) Lecture 6 October 3 2023 13 / 31

Structured Data

- We will use the popular Python Data Analysis Library (Pandas).
- Open source and freely available (part of anaconda distribution).
- See Lab 1 for directions on downloading it to your home machine.
- If you can't install on your computer, it is supported in https://repl.it/
- To use, add to the top of your program:

import pandas as pd

CSV Files

	l l	Undergraduate	
College	Full-time	Part-time	Total
Baruch	11,288	3,922	15,210
Brooklyn	10,198	4,208	14,406
City	10,067	3,250	13,317
Hunter	12,223	4,500	16,723
John Jay	9,831	2,843	12,674
Lehman	6,600	4,720	11,320
Medgar Evers	4,760	2,059	6,819
NYCCT	10,912	6,370	17,282
Queens	11,693	4,633	16,326
Staten Island	9,584	2,948	12,532
York	5,066	3,192	8,258

- Excel .xls files have much extra formatting.
- The text file version is called CSV for comma separated values.
- Each row is a line in the file.
- Columns are separated by commas on each line.

CSCI 127 (Hunter) Lecture 6 October 3 2023 15 / 31

Lehman	6,600	4,720	11,320
Medgar Evers	4,760	2,059	6,819
NYCCT	10,912	6,370	17,282
Queens	11,693	4,633	16,326
Staten Island	9,584	2,948	12,532
York	5,066	3,192	8,258

- To read in a CSV file: myVar = pd.read_csv("myFile.csv")
- Pandas has its own type, DataFrame, that is perfect for holding a sheet of data.
- Often abbreviated: df.
- It also has **Series**, that is perfect for holding a row or column of data.

Example: Reading in CSV Files

import matplotlib.pyplot as plt
import pandas as pd

pop = pd.read_csv("nycHistPop.csv",skiprows=5)

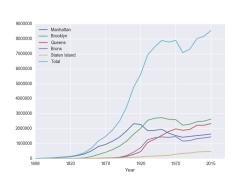

```

2010,1585873,2504700,2230722,1385108,468730,8175133 2015,1644518,2636735,2339150,1455444,474558,8550405

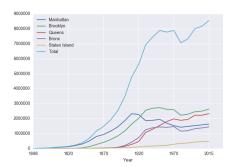

In Lab 6

pop.plot(x="Year")

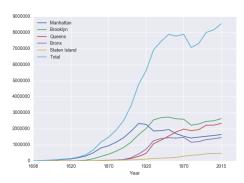

plt.show()

Series in Pandas

- Series can store a column or row of a DataFrame.
- Example: pop["Manhattan"] is the Series corresponding to the column of Manhattan data.
- Example:
 print("The largest number living in the Bronx is",
 pop["Bronx"].max())

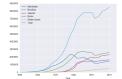

Challenge:

Predict what the following will do:

- print("Queens:", pop["Queens"].min())
- print("S I:", pop["Staten Island"].mean())
- print("S I:", pop["Staten Island"].std())
- pop.plot.bar(x="Year")
- pop.plot.scatter(x="Brooklyn", y= "Total")
- pop["Fraction"] = pop["Bronx"]/pop["Total"]

Solutions

Predict what the following will do:

- print("Queens:", pop["Queens"].min())
 Minimum value in the column with label "Queens".
- print("S I:", pop["Staten Island"].mean())
 Average of values in the column "Staten Island".
- print("S I :", pop["Staten Island"].std())
 Standard deviation of values in the column "Staten
 Island".
- pop.plot.bar(x="Year")
 Bar chart with x-axis "Year".
- pop.plot.scatter(x="Brooklyn", y= "Total")
 Scatter plot of Brooklyn versus Total values.
- pop["Fraction"] = pop["Bronx"]/pop["Total"]
 New column with the fraction of population that
 lives in the Bronx

Challenge:

		Undergraduate	
College	Full-time	Part-time	Total
Baruch	11,288	3,922	15,210

Staten Island	9,584	2,948	12,532
York	5,066	3,192	8,258

cunyF2016.csv

Write a complete Python program that reads in the file, cunyF2016.csv, and produces a scatter plot of full-time versus part-time enrollment.

Solution:

- Include pandas & pyplot libraries.
- 2 Read in the CSV file.
- 3 Set up a scatter plot.
- 4 Display plot.

Challenge:

		Undergraduate	
College	Full-time	Part-time	Total
Baruch	11,288	3,922	15,210
Brooklyn	10,198	4,208	14,406
City	10,067	3,250	13,317
Hunter	12,223	4,500	16,723
John Jay	9,831	2,843	12,674
Lehman	6,600	4,720	11,320
Medgar Evers	4,760	2,059	6,819

Queens	11,693	4,633	16,326
Staten Island	9,584	2,948	12,532
York	5,066	3,192	8,258

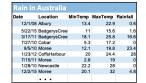

cunyF2016.csv

Write a complete Python program that reads in the file, cunyF2016.csv, and produces a scatter plot of full-time versus part-time enrollment.

Solution:

- Include pandas & pyplot libraries. import matplotlib.pyplot as plt import pandas as pd
- @ Read in the CSV file.
 pop=pd.read_csv("cunyF2016.csv",skiprows=1)
- 3 Set up a scatter plot.
 pop.plot.scatter(x="Full-time",y="Part-time")
- 4 Display plot.
 plt.show()

groupby()

output

•	
Adelaide	1.572185
Albany	2.255073
Albury	1.925710
AliceSprings	0.869355
BadgerysCreek	2.207925
Ballarat	1.688830
Bendigo	1.621452
Brisbane	3.160536
Cairns	5.765317
Canberra	1.735038
Cobar	1.129262
CoffsHarbour	5.054592

Sometimes you have recurring values in a column and you want to examine the data for a particular value.

For example, to find the average rainfall at each location:

- Import libraries. import pandas as pd
- Read in the CSV file. rain = pd.read_csv("AustraliaRain.csv",skiprows=1)
- Group the data by location. groupAvg = rain.groupby("Location")
- Print the average rainfall at each location. print(groupAvg["Rainfall"].mean())

get_group()

output

1.9257104647275156

Sometimes you have **recurring values in a column** and you want to examine the data for a particular value.

For example, to find the average rainfall at one location, e.g. Albury:

- 1 Import libraries. import pandas as pd
- 2 Read in the CSV file.
 rain =
 pd.read_csv("AustraliaRain.csv",skiprows=1)
- Group the data by location get data for group
 Albury.
 AlburyAvg =
 rain.groupby("Location").get_group("Albury")
- Print the average rainfall in Albury.
 print(AlburyAvg["Rainfall"].mean())

Design Challenge

Stars						
Temperature (K)	Luminosity(L/Lo)	Radius(R/Ro)	Absolute magnitude(Mv)	Star type	Star color	Spectral Class
3068	0.0024	0.17	16.12	Brown Dwarf	Red	M
25000	0.056	0.0084	10.58	White Dwarf	Blue White	В
2650	0.00069	0.11	17.45	Brown Dwarf	Red	M
11790	0.00015	0.011	12.59	White Dwarf	Yellowish White	F
15276	1136	7.2	-1.97	Main Sequence	Blue-white	В
5800	0.81	0.9	5.05	Main Sequence	yellow-white	F
16500	0.013	0.014	11.89	White Dwarf	Blue White	В
3192	0.00362	0.1967	13.53	Red Dwarf	Red	M
6380	1.35	0.98	2.93	Main Sequence	yellow-white	F
3834	272000	1183	-9.2	Hypergiant	Red	М

- Design an algorithm that:
 - ▶ Prints the luminosity of the brightest star.
 - ▶ Prints the temperature of the coldest star.
 - ▶ Prints the average radius of a Hypergiant.

Design Challenge - Solution

Stars						
Temperature (K)	Luminosity(L/Lo)	Radius(R/Ro)	Absolute magnitude(Mv)	Star type	Star color	Spectral Class
3068	0.0024	0.17	16.12	Brown Dwarf	Red	M
25000	0.056	0.0084	10.58	White Dwarf	Blue White	В
2650	0.00069	0.11	17.45	Brown Dwarf	Red	M
11790	0.00015	0.011	12.59	White Dwarf	Yellowish White	F
15276	1136	7.2	-1.97	Main Sequence	Blue-white	В
5800	0.81	0.9	5.05	Main Sequence	yellow-white	F
16500	0.013	0.014	11.89	White Dwarf	Blue White	В
3192	0.00362	0.1967	13.53	Red Dwarf	Red	M
6380	1.35	0.98	2.93	Main Sequence	yellow-white	F
3834	272000	1183	-9.2	Hypergiant	Red	M

- Libraries: pandas
- Process:
 - ► Print max of 'Luminosity' column
 - ► Print min of 'Temperature' column
 - groupby 'Star Type' and get group 'Hypergiant' to print average 'Radius'

Design Challenge - Code

Libraries: pandas import pandas as pd stars = pd.read_csv("stars.csv")

- Process:
 - ▶ Print max of 'Luminosity' column print(stars["Luminosity(L/Lo)"].max())
 - ▶ Prints min of 'Temperature' column and store it in temp variable print(stars["Temperature (K)"].min())
 - groupby 'Star Type' and get group 'Hypergiant' to print average 'Radius'

```
print(stars.groupby("Star type")
.get_group("Hypergiant")["Radius(R/Ro)"].mean())
```

Recap

- Recap: Logical Expressions & Circuits
- Accessing Formatted Data:
 - Pandas library has elegant solutions for accessing & analyzing structured data.
 - Can manipulate individual columns or rows (Series).
 - ► Has useful functions for the entire sheet (DataFrame) such as plotting.

Final Questions

- Since you must pass the final exam to pass the course, we end every lecture with final exam review.
- Pull out something to write on (not to be turned in).
- Lightning rounds:
 - write as much you can for 60 seconds;
 - followed by answer; and
 - ► repeat.
- Past exams are on the webpage (under Final Exam Information).
- We're starting with Fall 2019, Version 2.

Lecture Slips & Writing Boards

- Hand your lecture slip to a UTA.
- Return writing boards as you leave.

31 / 31

CSCI 127 (Hunter) Lecture 6
