Fill in Missing Pieces

Fill in Missing Pieces

1 Write import statements.

import turtle

Third Part: Fill in Missing Pieces

```
    Write import statements.
```

2 Write down new function names and inputs.

```
import turtle
def setUp():
    #FILL IN
def getInput():
    #FILL IN
def markLocation(t,x,y):
```

```
#FILL IN
```

```
def main():
    tess = setUp()  #Returns a purple turtle with pen up.
    for i in range(5):
        x,y = getInput()  #Asks user for two numbers.
        markLocation(tess,x,y) #Move tess to (x,y) and stamp.
        CSci 127 (Hunter)  Lecture 9  Summer 2020 17 / 36
```

Third Part: Fill in Missing Pieces

- Write import statements.
- 2 Write down new function names and inputs.
- ③ Fill in return values.

```
import turtle
def setUp():
    #FILL IN
    return(newTurtle)
def getInput():
    #FILL IN
    return(x,y)
def markLocation(t,x,y):
    #FILL IN
```

```
def main():
    tess = setUp()  #Returns a purple turtle with pen up.
    for i in range(5):
        x,y = getInput()  #Asks user for two numbers.
        markLocation(tess,x,y) #Move tess to (x,y), and stamp. = > = >
```

Third Part: Fill in Missing Pieces

- Write import statements.
- 2 Write down new function names and inputs.
- ③ Fill in return values.
- ④ Fill in body of functions.

```
import turtle
def setUp():
    newTurtle = turtle.Turtle()
    newTurtle.penup()
    return(newTurtle)
def getInput():
    x = int(input('Enter x: '))
    y = int(input('Enter y: '))
    return(x,y)
def markLocation(t,x,y):
    t.goto(x,y)
    t.stamp()
def main():
    tess = setUp()
                        #Returns a purple turtle with pen up.
    for i in range(5):
         x,y = getInput()
                                   #Asks user for two numbers.
                                                                               Sac
     CSci 127 (Hunter)
                                      Lecture 9
                                                                  Summer 2020
                                                                               19 / 36
```

• Write a function that takes a number as an input and prints its corresponding name.

9990

- Write a function that takes a number as an input and prints its corresponding name.
- For example,

990

- Write a function that takes a number as an input and prints its corresponding name.
- For example,
 - num2string(0) returns: zero

Sac

- Write a function that takes a number as an input and prints its corresponding name.
- For example,
 - num2string(0) returns: zero
 - num2string(1) returns: one

Sac
- Write a function that takes a number as an input and prints its corresponding name.
- For example,
 - num2string(0) returns: zero
 - num2string(1) returns: one
 - num2string(2) returns: two

Sac

- Write a function that takes a number as an input and prints its corresponding name.
- For example,
 - num2string(0) returns: zero
 - num2string(1) returns: one
 - num2string(2) returns: two

• You may assume that only single digits, 0,1,...,9, are given as input.

 Indefinite loops repeat as long as the condition is true.

```
dist = int(input('Enter distance: '))
while dist < 0:
    print('Distances cannot be negative.')
dist = int(input('Enter distance: '))</pre>
```

print('The distance entered is', dist)

```
print(nums)
```

- Indefinite loops repeat as long as the condition is true.
- Could execute the body of the loop zero times, 10 times, infinite number of times.

3

```
dist = int(input('Enter distance: '))
while dist < 0:
    print('Distances cannot be negative.')
    dist = int(input('Enter distance: '))</pre>
```

print('The distance entered is', dist)

```
#Spring 2012 Final Exam, #8
```

```
nums = [1,4,0,6,5,2,9,8,12]
print(nums)
i=0
while i < len(nums)-1:
    if nums[i] < nums[i+1] = nums[i+1], nums[i]
    i=i+1</pre>
```

```
print(nums)
```

- Indefinite loops repeat as long as the condition is true.
- Could execute the body of the loop zero times, 10 times, infinite number of times.
- The condition determines how many times.

```
dist = int(input('Enter distance: '))
while dist < 0:
    print('Distances cannot be negative.')
    dist = int(input('Enter distance: '))</pre>
```

print('The distance entered is', dist)

```
#Spring 2012 Final Exam, #8
```

```
nums = [1,4,0,6,5,2,9,8,12]
print(nums)
i=0
wile i< len(nums)-1:
    if nums[i] < nums[i:1]:
        nums[i], nums[i:1] = nums[i:1], nums[i]
        i=i1
</pre>
```

print(nums)

- Indefinite loops repeat as long as the condition is true.
- Could execute the body of the loop zero times, 10 times, infinite number of times.
- The condition determines how many times.
- Very useful for checking input, simulations, and games.

```
dist = int(input('Enter distance: '))
while dist < 0:
    print('Distances cannot be negative.')
    dist = int(input('Enter distance: '))</pre>
```

print('The distance entered is', dist)

```
#Spring 2012 Final Exam, #8
```

```
nums = [1,4,0,6,5,2,9,8,12]
print(nums)
i=0
while i < len(nums)-1:
    if nums[i] < nums[i:1]:
        nums[i], nums[i:1] = nums[i+i], nums[i]
        i=i:1</pre>
```

print(nums)

- Indefinite loops repeat as long as the condition is true.
- Could execute the body of the loop zero times, 10 times, infinite number of times.
- The condition determines how many times.
- Very useful for checking input, simulations, and games.
- More details next lecture...

Recap

 Top-down design: breaking into subproblems, and implementing each part separately.

Э

990

Recap

- Top-down design: breaking into subproblems, and implementing each part separately.
- Excellent approach: can then test each part separately before adding it to a large program.
